

Blender and homogenizer for preparing  
Homemade Ice Cream Mix  
And much more...

Turbomix  
Turbomix

### Vertical Travel

In order to blend and emulsify different quantities of mix, the Turbomix has a vertical travel of almost 40 cm. This vertical movement is assisted by a weighted system, which makes it easy to move the motor up or down. It is possible to block the motor arm at the desired height, using the appropriate knob.

### Horizontal Oscillation

The Turbomix can be moved in circles, by guiding the motor with the handles, in order to allow the emulsifier turbine to absorb the solid ingredients that tend to the sides of the bucket. This horizontal oscillation has a maximum diameter of nearly 25 cm.

### Control Panel

This controls all functions of the Turbomix: the on/off button, the timer to programme the blending time, and the led bar to control the motor speed. The emergency button stops the machine immediately upon being pressed.
